Dedication to the research community is a key ingredient in every Harlan Teklad Product.

Custom research diets are an important tool for your research involving all types of laboratory animals. Teklad custom research diets are used in the study of atherosclerosis, obesity, insulin resistance, diabetes, cancer, hypertension, stroke, toxicology, gene induction, renal disease, pancreatitis, neurological disorders, and other areas. We are dedicated to quality in all aspects of ingredient selection, diet formulation and production, and customer service. We also supply ingredients for those who prepare their own diets. Contact our knowledgeable technical staff to discuss your specific diet needs. Together, your input and our expertise will enhance your research.

Phytoestrogens in my lab animal diet?

Do you know that grain-based diets contain significant and variable levels of phytoestrogens? If your studies involve pathways which are influenced by estrogenic activity, the diet you feed can have profound effects on your animal model at the genetic, molecular, and cellular level.

Get your research under control with phytoestrogen-free purified-ingredient OpenSource Diets™. A product of Research Diets, Inc. Contact our Resource Center at info@researchdiets.com Your results could depend on it.

Commonly used DIO Diet Series:
The “Surwit” series of diets is one example of diets developed to study the effect of the amount and type of both dietary carbohydrates and fats on body fat composition, glucose metabolism, and obesity and diabetes inducement.

No one knows more about the nutrition required for your DIO research than the experts at Purina TestDiet®.

That’s why we produce a multitude of formulas for research in obesity, diabetes, metabolic syndrome, and related diseases. Using purified diets for obesity research provides the researcher a reliable and consistent tool to study the effect of specific nutrients on the onset and progress of this disease. By using these same diets for the study of related disorders, such as diabetes, the researcher can effectively and efficiently study the common dietary basis of diverse syndromes.

The “TestDiet® DIO Series”™ was developed when increased attention was given to the role of fiber in fat digestion and metabolism in the 21st Century, in diets for obesity, diabetes, metabolic syndrome, and related studies based upon our globally-respected TestDiet® #5755 Basal Diet. This diet series provides a balanced combination of both soluble and insoluble fiber and complex and simple carbohydrates.

Custom variations are available upon request. For more information on these and any other TestDiet® products, please visit www.testdiet.com, email info@testdiet.com or call 1-765-966-1888.
