ONLINE SUPPLEMENTAL FIGURE 1 Levels of the p85 (A) and p85α (B) subunits of PI 3-kinase, and Akt (C) proteins in scraped colonic mucosa isolated from rats consuming diets containing 0 or 4.5 g/kg quercetin and either injected with saline or the colon-specific carcinogen azoxymethane (AOM). Bars represent least squares means ± SEM, n = 10 rats/group. Expression of the p85 subunit of PI 3-kinase was suppressed (P < 0.003) by AOM injection. No other differences were detected.
