Supplemental Figure 3. Association between change in iron status and change in performance on Sternberg Memory Search (SMS) task following bean consumption for 18 weeks in non-anemic women. Non-anemic defined as hemoglobin ≥ 120 g/L. Only outcomes for which $R^2 > 0.10$ compared to an intercept-only model (Table 4) are shown. Panels are shown for associations between change in ferritin and change in reaction time (RT) intercept on trials with new (A) and old (B) items; change in body iron and change in RT intercept on trials with new (C) and old (D) items.
